

Growth Lab

Identifying local opportunities: Bernalillo County

January 2025

Key Takeaways on Bernalillo County's Economic Snapshot

The first part of this presentation provides an economic snapshot of the county. The following key takeaways stand out.

- **Economic cluster:** Bernalillo County is the primary hub of economic activity in New Mexico. The wider cluster, centered in Albuquerque, reaches into other counties but does not overlap with the cluster originating in Santa Fe.
 - **Long-term trajectory:** Since 1900, Bernalillo County has been the largest in the state by population. By 1940, it was already distinct from other urban counties, but significant population growth since then has widened the gap with other counties in the state. However, population growth in Bernalillo County has been gradual and moderate compared to more explosive growth in other large metropolitan areas in the wider region.
 - **Recent economic performance:** Economic growth has been sluggish over the past few decades. The county experienced a long period of stagnant growth from 2004 to 2013. Although there was a recovery thereafter, this growth has been slower than that of several of its peers outside the state. As the economy entered a new phase, population growth was very low between 2010 and 2020, and income growth has lagged behind that of other urban areas in New Mexico and neighboring states.
 - **Underlying economic engines:** The county economy relies on several service sectors to drive growth and has limited growth coming from government output and construction activity, which is declining. Professional, health, and education services consistently lead growth, with financial activities also making a contribution. Although manufacturing represents a small part of the economy, it has seen growth over time.
 - **Housing dynamics:** No other peer county has added fewer units in the past decade. Despite very modest population growth, Bernalillo County's housing market is overheating. The housing stock grew by only 5%, prices surged by nearly 40% as construction of new units has not kept up with the rising demand for housing. The county has a declining vacancy rate (which was already below 10%).
 - **Conclusion:** As Bernalillo County grows, rising housing prices are hindering its ability to attract and keep talent, ultimately preventing it from fully capitalize on existing productive capabilities.
-

Observations on Bernalillo County's Diversification Opportunities Growth Lab

The second part of this presentation provides an analysis of diversification opportunities grounded in an economic complexity approach. This analysis is meant as an input for local strategy rather than a conclusive list. Several observations are noteworthy that may warrant local investigation.

- **Financial services have been a stable driver but could generate more tradable income for the county.** Several tradable industries within this sector have lost jobs annually in the commuting zone (CZ). “Financial Transactions Processing, Reserve, and Clearinghouse Activities” is one of the few exceptions that has been adding jobs. “Investment Banking and Securities Intermediation” stands out as facing location-specific constraints in its expansion because it has been losing many jobs in the CZ but adding jobs elsewhere in the state.
 - **The construction sector, critical to address the housing issue, has been shrinking when it should be experiencing growth.** In a sector that has been recently declining, the “Industrial Building Construction” industry is an exception, as it has been adding roughly one job per year in the CZ. This number is much lower than in other areas; across the state, the same industry has added about 25 jobs.
 - **Manufacturing has growth potential, particularly in industries that require lower electrical loads.** Manufacturing has slowed its expansion in the county over time. As the state is actively engaging in site-readiness efforts, the analysis shows unexpected opportunities. “Coffee and Tea Manufacturing” could be a good fit. The industry has already been adding jobs in the CZ, contrary to the overall state-level trend. It has a low electricity load, and the space requirements could be met by the county's strategic sites and industrial parks. “All Other Miscellaneous Chemical Product and Preparation Manufacturing” may also be a promising opportunity, although it has higher requirements, particularly with respect to electricity load.
-

County economic snapshot

Unpacking population and economic patterns

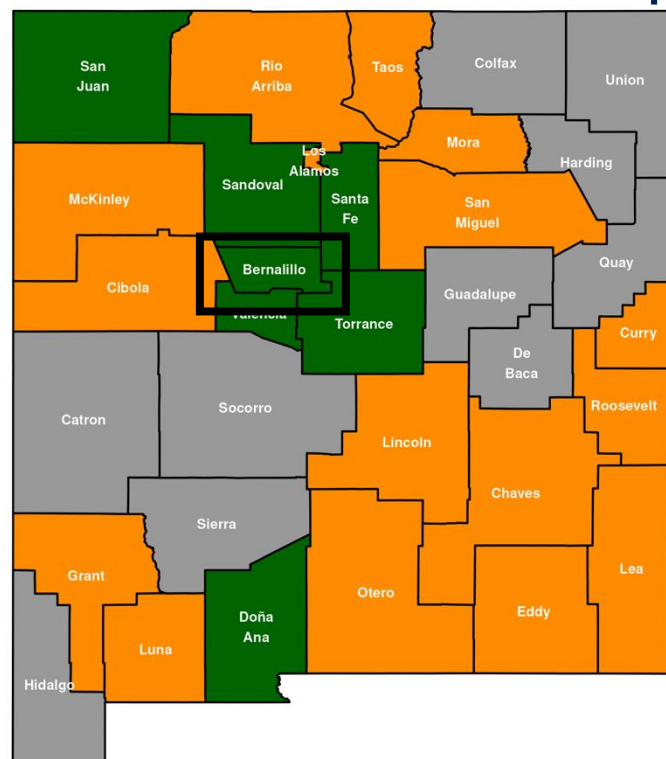

Bernalillo county location

Economic cluster – Firms in Bernalillo county & New Mexico

Map of Counties and Statistical Areas in New Mexico

County Type ■ Metropolitan ■ Micropolitan ■ Rural

Source: U.S. Census Bureau

New Mexico Firms' Location

Note 1: Each blue dot represents a firm.
Note 2: The green hulls enclose economic clusters.
Source: Dun and Bradstreet, 2023

The county type definitions are based on the size of local population centers and their connection to larger urban areas. Metropolitan and micropolitan areas differ by the size of their core community, with a threshold of 50,000 residents. In contrast, rural areas do not have a population center with at least 10,000 residents.

The clusters of economic activity (shown by the green outlines) are defined by the proximity of firms (blue dots). These clusters reveal connections between counties, both within the state and across state borders.

Economic cluster – Firms in Bernalillo county and adjacent counties

Bernalillo County and Neighbors Firms' Location

Bernalillo's economic cluster extends across county lines into Sandoval to the north, Santa Fe and Torrance to the west, and Valencia to the south. While Albuquerque concentrates much of the economic activity, the cluster reaches beyond the city's borders.

Note 1: Each blue dot represents a firm.
Note 2: The green hulls enclose economic clusters.
Note 3: Counties are colored by their state.

Long-term trajectory – Population growth among New Mexico’s counties

Understanding Bernalillo’s economy requires looking at the county’s long-term evolution. Demographic and economic trends are closely connected: job opportunities attract people and drive population growth, while job losses can lead to outmigration. At the same time, the size and skills of population influences which new economic activities, as critical mass of knowhow and networks enable economic activity.

Bernalillo’s long-term population growth is shown alongside New Mexico’s other largest counties.

Graph source: Decennial Census via New Mexico Economic Development Department

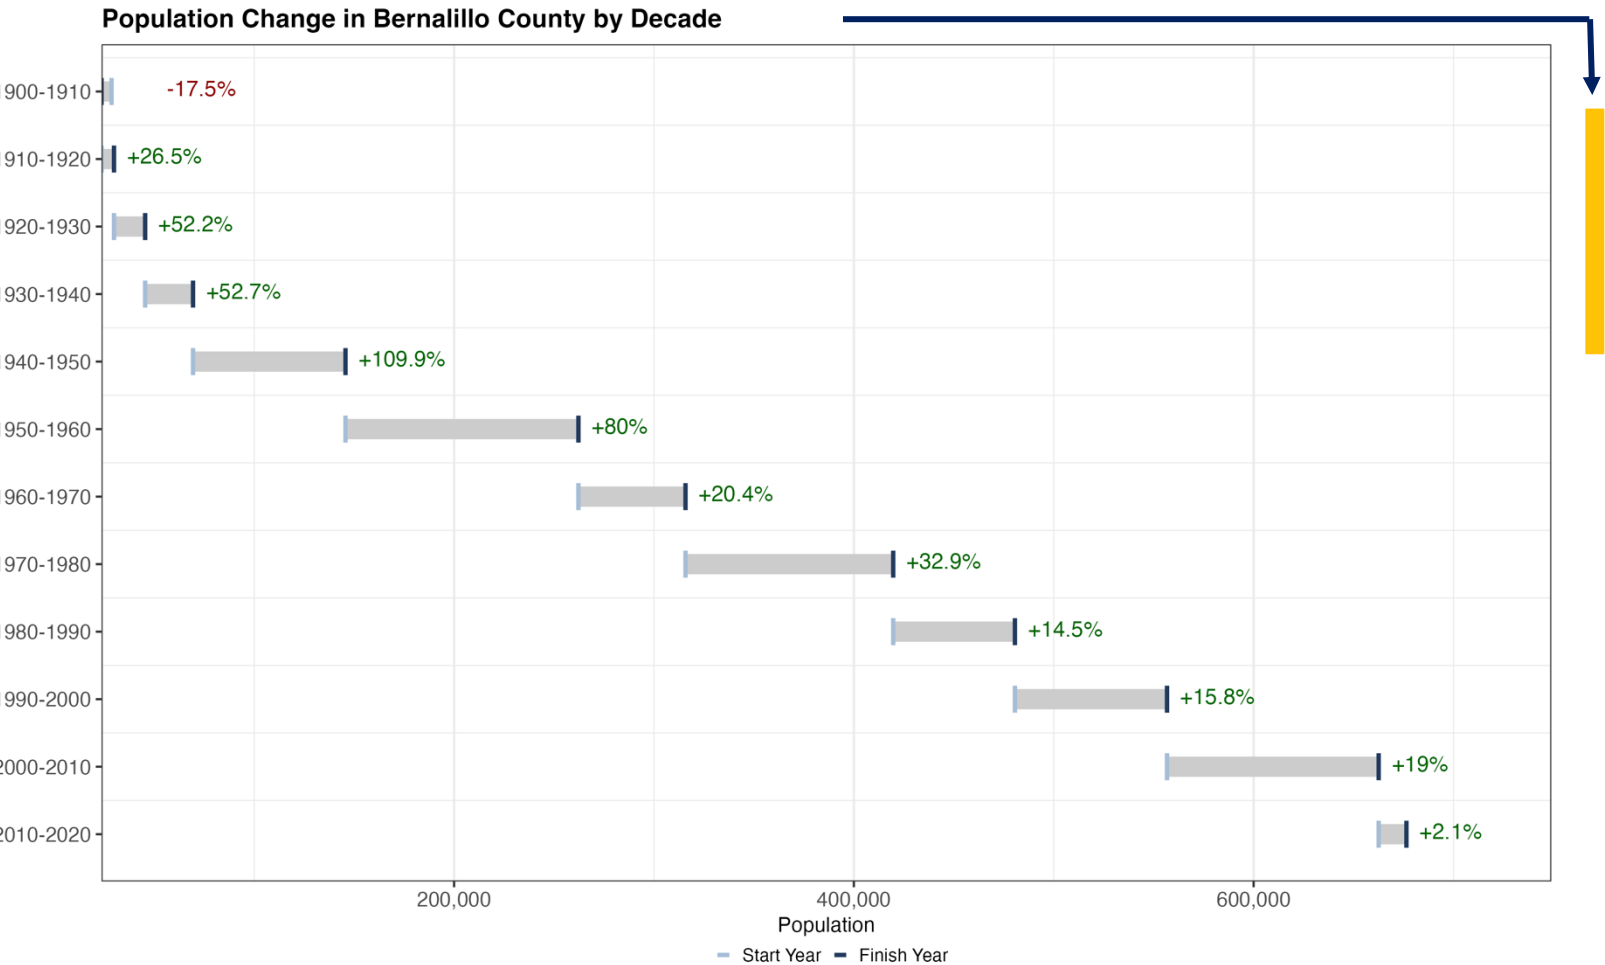

Long-term trajectory – Population growth among peers

The previous slide compared Bernalillo’s long-term population growth with other large counties in New Mexico. To give further context, the following analysis looks at a set of peer counties across New Mexico and five neighboring states (Arizona, Colorado, Oklahoma, Texas, and Utah). These counties were selected because they are large metro areas.

Graph source: Van Leuven, Andrew J, 2024, "Historical U.S. County Population Data: 1900 to 2020"

Long-term trajectory – Population growth by decade

Now, the focus shifts from comparing long-term trends to examining Bernalillo's population changes decade by decade. This graph shows the population at the start and end of each decade, as well as the total growth rate during each period.

Recent economic performance – Income level growth

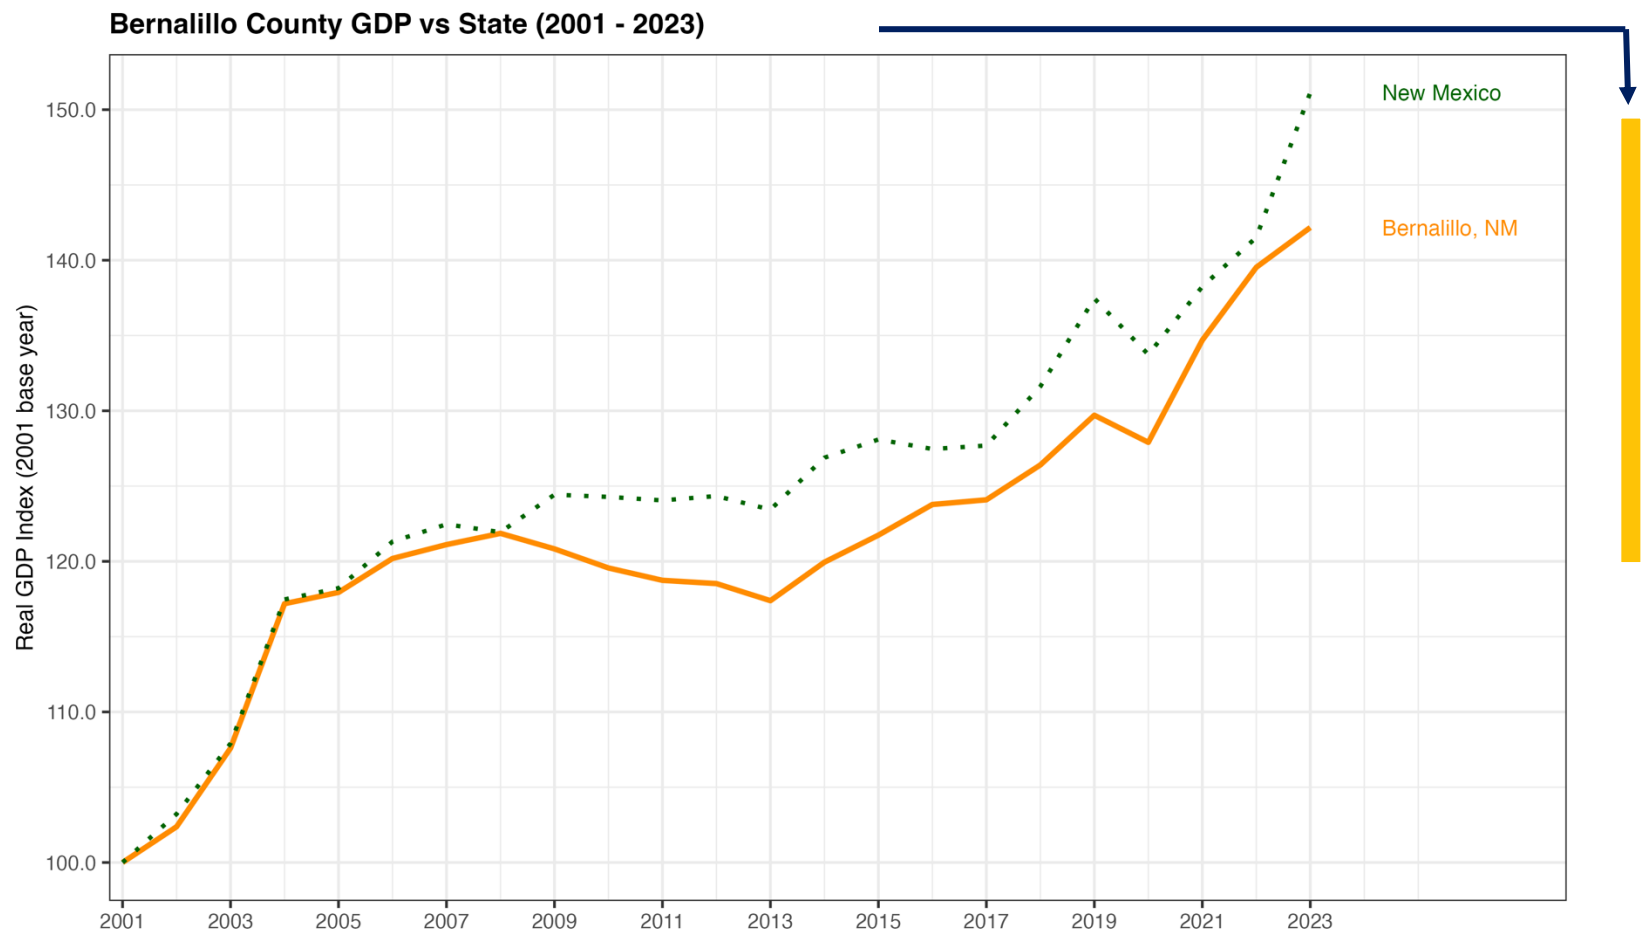

Demographic trends offer a long-term perspective on Bernalillo's economy. For a closer look at more recent decades, Gross County Product (GCP) provides annual data going back to 2001, capturing the value of economic activity produced within the county's borders. Dividing GCP by the local population gives a per capita figure, which serves as income level, a useful benchmark for comparing overall standards of living between places.

Bernalillo's average income growth rate is shown here alongside New Mexico's 32 other counties, the state average, and neighboring states.

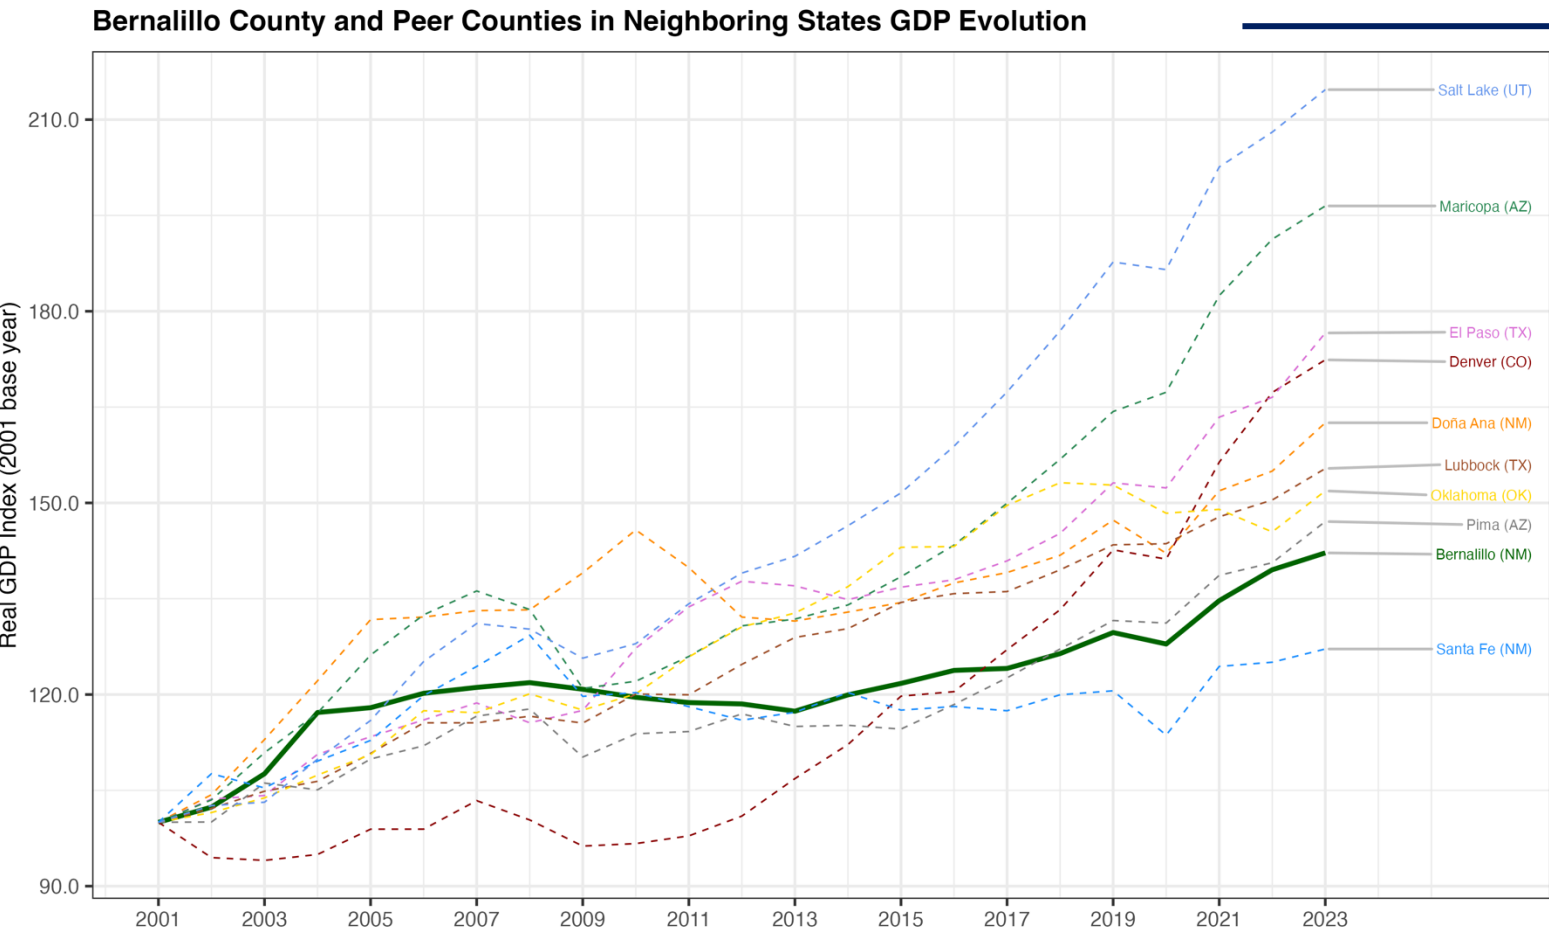

Source: Bureau of Economic Analysis (BEA) and U.S. Census Bureau via FRED
Note: the dotted lines are the averages of GSP growth rate

Recent economic performance – Gross County Product

Shifting from per capita measures to total GCP levels gives a sense of the overall size of the local economy, based on everything produced within the county's borders. To make comparisons between places clearer, GCP is shown as an index using 2001 as the base year. This approach allows for easy tracking of economic trajectories across places of different sizes and helps highlight specific periods when significant changes or challenges occurred. Bernalillo's economic trajectory is shown alongside that of New Mexico as a whole.

Recent economic performance – GCP trajectory relative to peers

This graph uses the same set of peer counties as in the population comparison but now focuses on economic trends. As with the previous comparison to the state, each county's GCP is indexed to 2001, making it easier to spot major changes and differences in trajectory over time. Bernalillo's GCP is shown alongside that of its peer counties.

Underlying economic engines

GCP can be broken down into the sectors that drive the local economy. The following graph does this by showing each sector's average growth rate and share of the economy before and after the financial crisis. Each dot is a sector; its position reflects both its average growth and its importance to the county's economy.

Source: Bureau of Economic Analysis (BEA)
Note: This RCA is comparing the county's share vs US to identify the distinctive sectors for the county.
Note 2: Some sectors are not included in both graphs due to data availability

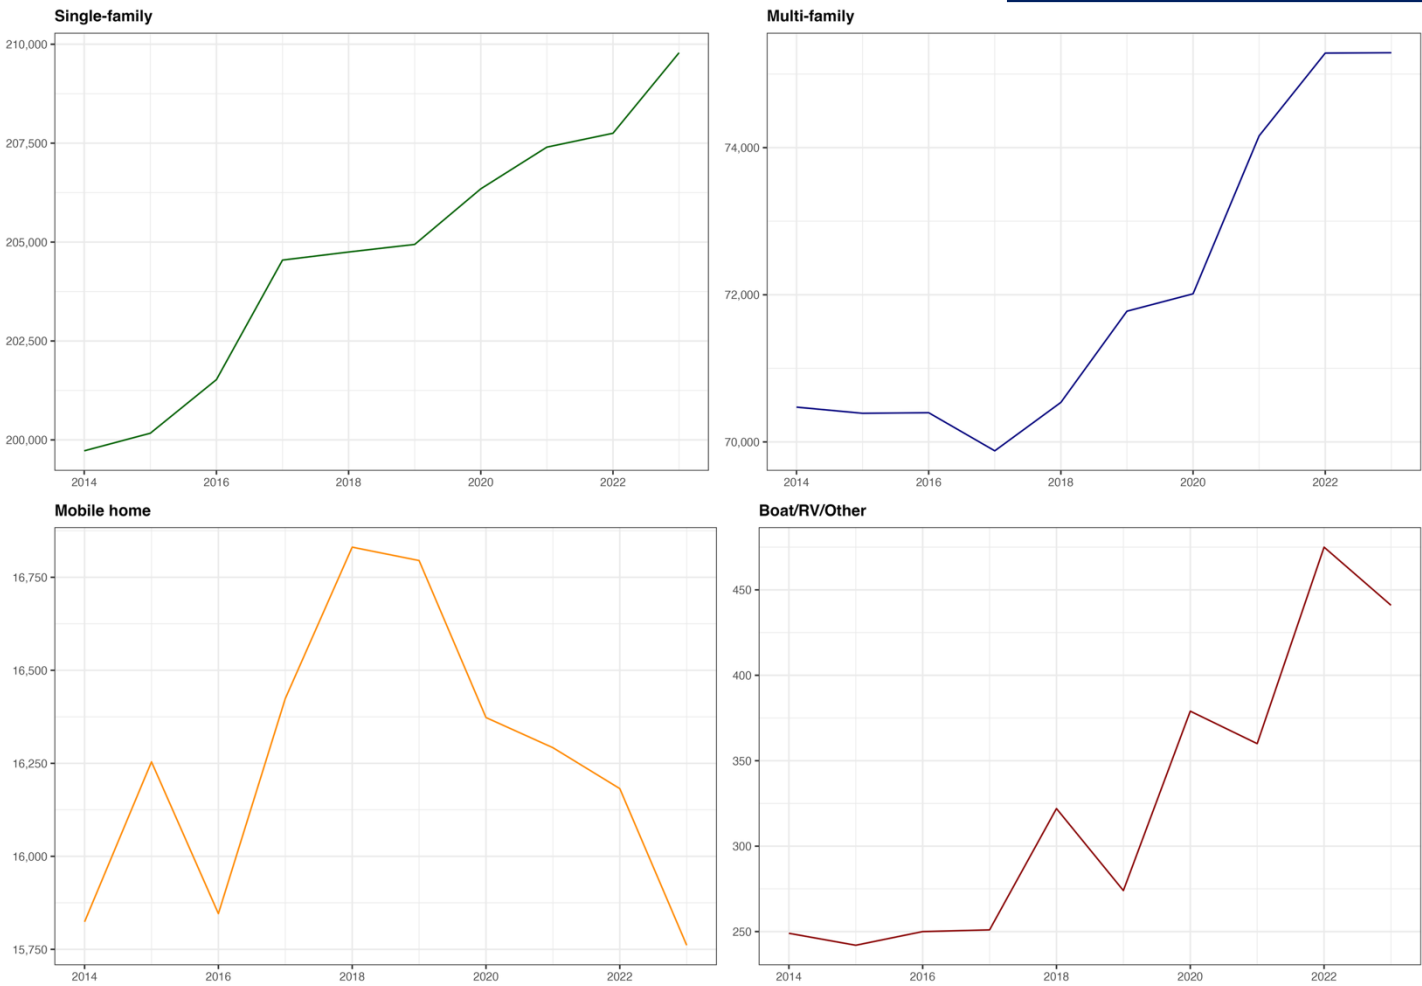

Housing dynamics – local prices and housing supply

So far, the analysis has focused on economic activity as a driver of growth. However, as noted earlier, people are not only drawn by job opportunities, but also by the overall quality of life a place can offer. Factors such as amenities, public services, and housing availability all play a role in where people choose to live. While this analysis doesn't cover every factor, it offers some insight into a community's ability to attract and retain talent by examining trends in housing demand and supply.

Housing dynamics – Breakdown of housing supply

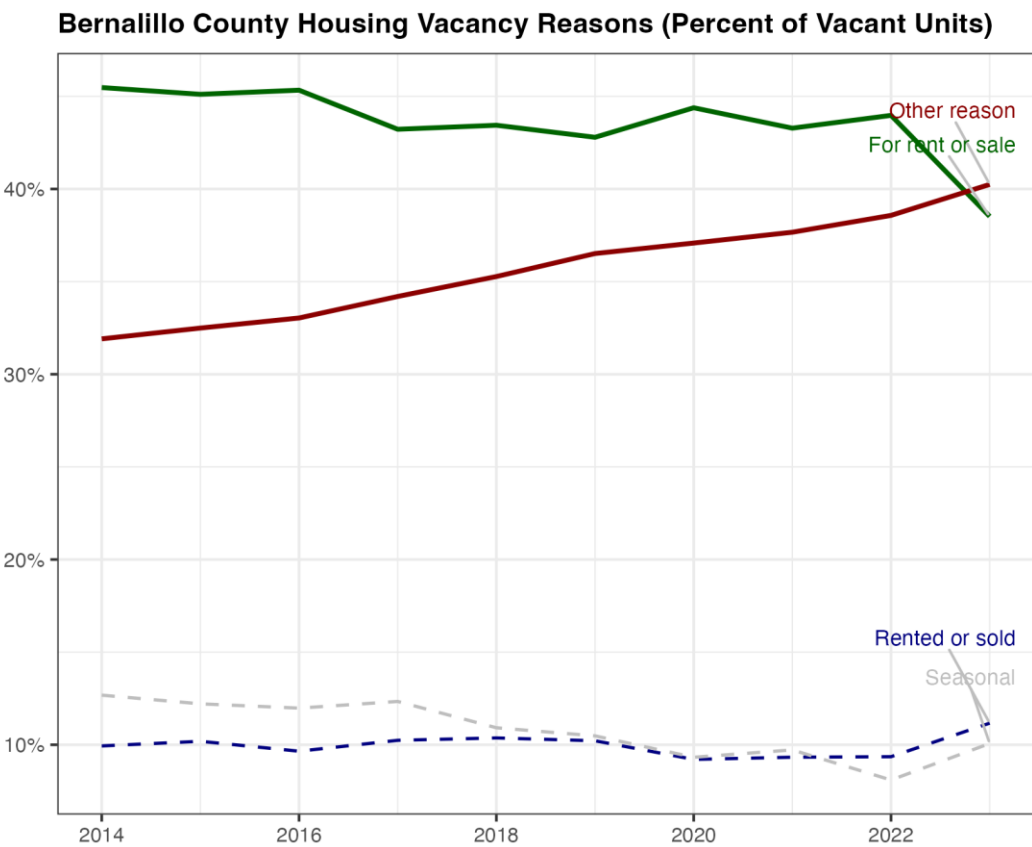

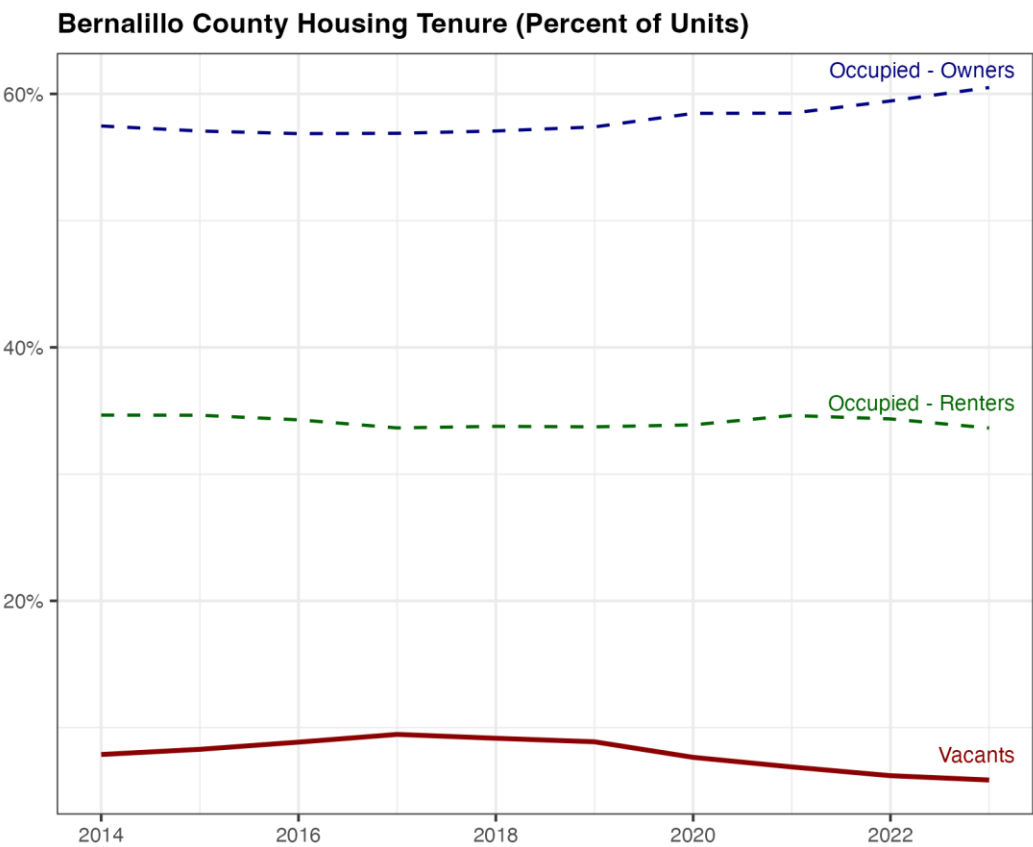

Bernalillo County Housing Units by Type (2014-2023)

The U.S. Census Bureau classifies the housing structure according to how many units it has: one, two, three and so on. This analysis uses four main categories: Single-family (only one unit), Multi-family (two or more units), Mobile homes and Boat/RV or other types of housing.

Housing dynamics – Tenure and vacancy

Housing units can be occupied by either owners or renters, while some remain vacant for various reasons. Some vacant units are already taken and are awaiting new residents, while others are actively on the market for rent, for sale, or available seasonally. The most concerning are those listed as vacant for “Other” or unclear reasons.

Housing dynamics – Comparison with peers

The previous slides examined Bernalillo County’s housing supply and demand on its own. The following graphs add context by comparing these trends to the same peer counties used earlier

Evolution of Real House Prices by County (2014 - 2024)

Evolution of Housing Units by County (2014 - 2024)

Diversification opportunities

Which industries are better positioned to fuel Bernalillo County's economy?

Overview of the selection of promising industries

- **Background.** The prior section, “County Economic Snapshot,” provided a preliminary diagnosis of the county’s current situation by examining main population and economic trends. This analysis helps clarify whether the county faces greater challenges in fostering economic activity or in attracting and retaining workers for future growth. Regardless of these constraints, every community can benefit from identifying which industries are best positioned to bring new jobs.
 - **Complement to local knowledge.** While local stakeholders often have valuable insights into which industries could thrive, the sheer number of possible options, over 1,000 industries at the 6-digit NAICS level, means there is room to complement local knowledge with data-driven observations, including some that may not be immediately obvious as a local fit.
 - **Selection.** From the whole universe of potential industries, the analysis first identifies the industries the country is already good at and, second, other industries that require similar capabilities to these. Finally, it focuses in on which of these are tradable industries. Within tradable industries that align with the region’s existing capabilities, there are two key groups. “Already Competitive” industries have a strong local presence and serve as current economic strengths. “Potential Opportunities” are industries that are either smaller or not yet established locally, but whose growth requirements closely match the local economy’s current mix of know-how, skills, infrastructure, and other inputs (productive capabilities). These industries may offer pathways for future job creation and diversification.
 - **Building blocks.** These groupings are based on an approximation of the local productive capabilities (knowhow, skills, infrastructure and other inputs) and how well these match the needs of different industries. By examining both the mix of existing industries and their broader relationships, the analysis highlights which industries the local economy is best equipped to support, either by reinforcing established strengths or by fostering new sources of job growth.

Our analysis is built on three cornerstones

Local Capabilities

What is Bernalillo good at?

Revealed Comparative Advantage (RCA) or Location Quotient (LQ) as key metric

Industries Relatedness

How interconnected are industries with one another and with Bernalillo's capabilities?

Proximity and Density as key metrics

Tradable Income

Which industries can bring external income to Bernalillo?

Tradable or base industries that export goods and services

Our analysis is built on three cornerstones

Local Capabilities

What is Bernalillo good at?
*Revealed Comparative Advantage
(RCA) or Location Quotient (LQ) as key
metric*

Industries Relatedness

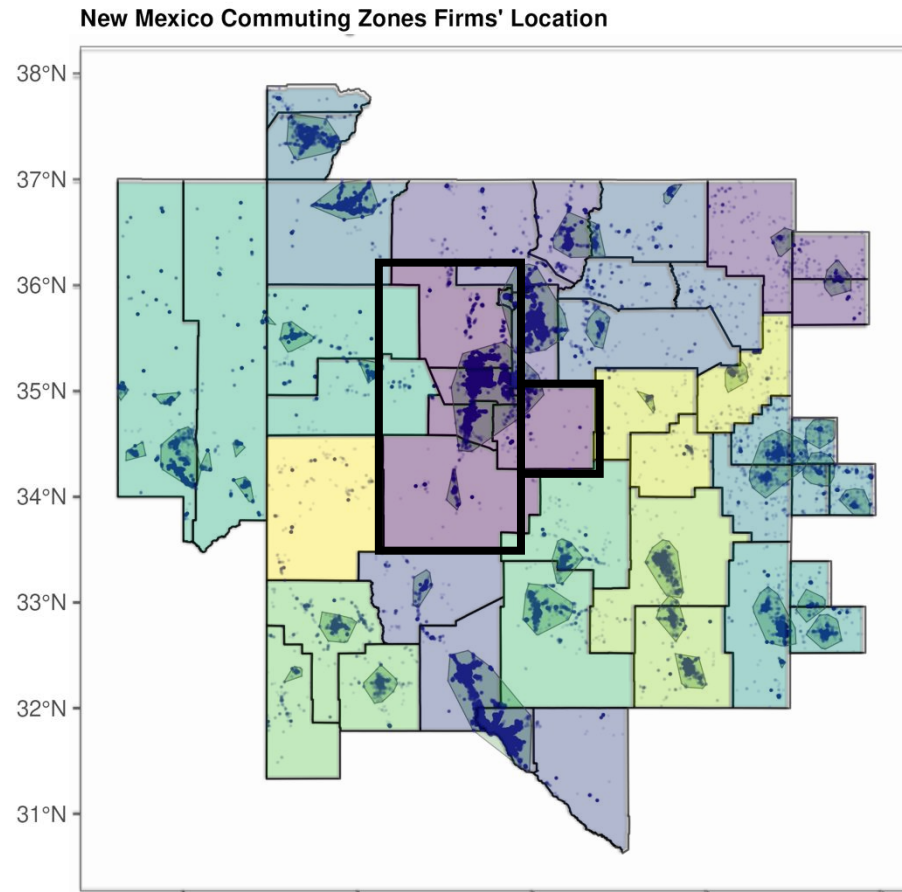

Tradable Income

What is considered “local”? Beyond administrative borders

➤ *We think of the local economy as a commuting zone (CZ).*

Workers often commute beyond the administrative boundaries of towns and cities. To capture this, the USDA defines commuting zones across the country, grouping areas based on where residents travel for work.

Bernalillo's commuting zone, highlighted by the black square on the left map, includes Sandoval, Socorro, Torrance and Valencia counties (NM).

The analysis in this document focuses on Bernalillo's commuting zone (CZ), so references to Bernalillo refer to its CZ

Which are Bernalillo capabilities? Looking for signals

➤ *Productive capabilities could be collective knowhow, skills, infrastructure and other inputs. We cannot observe all, but the current economic activity gives us a hint of which industries they can support.*

Key metric:

$$RCA = \frac{\% \text{ of CZ Jobs in industry } i}{\% \text{ of US Jobs in industry } i}$$

➤ *By comparing an industry's presence in the CZ relative to its presence nationally, it tells us what is Bernalillo good at.*

For example:

■ County share ■ U.S Share

RCA = 3 (RCA > 1, Competitive edge). The CZ has the capabilities to excel in this industry.

RCA = 0.5 (RCA < 1, Not competitive). The CZ has some capabilities to participate in the industry

RCA = 0 (No presence). The industry is not currently active, but it could be developed in the future

Our analysis is built on three cornerstones

Local Capabilities

Industries Relatedness

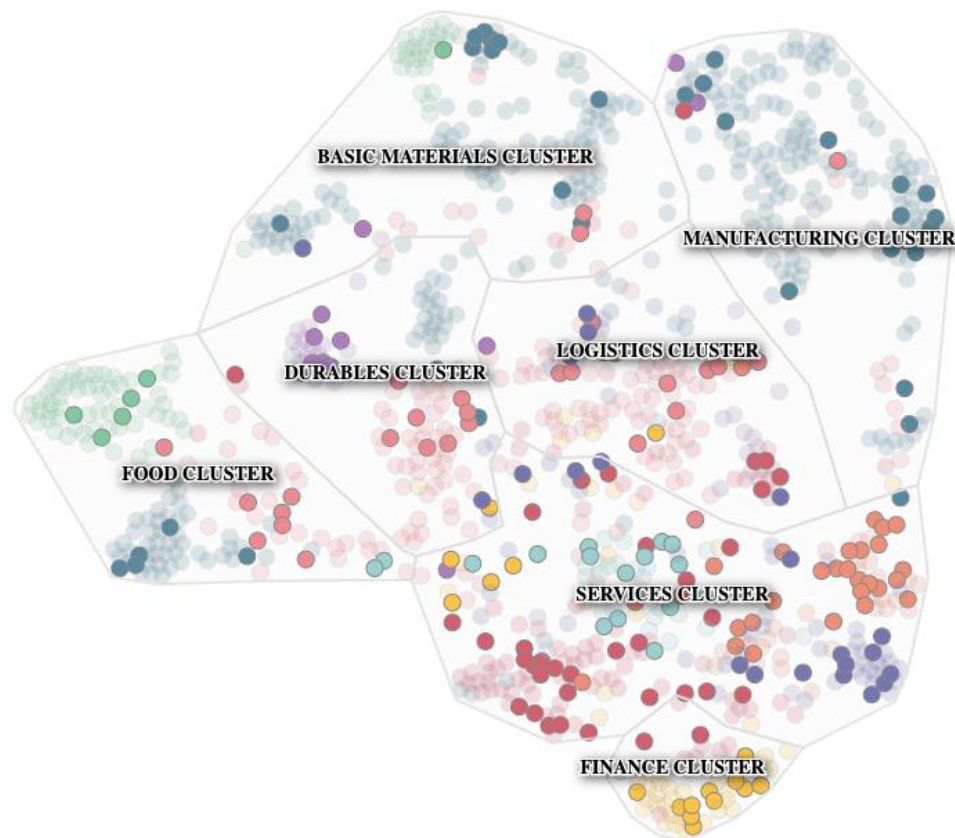

*How interconnected are industries
with one another and with
Bernalillo's capabilities?
Proximity and Density as key metrics*

Tradable Income

What else could Bernalillo capabilities support? Let's start by looking at the relationships between industries

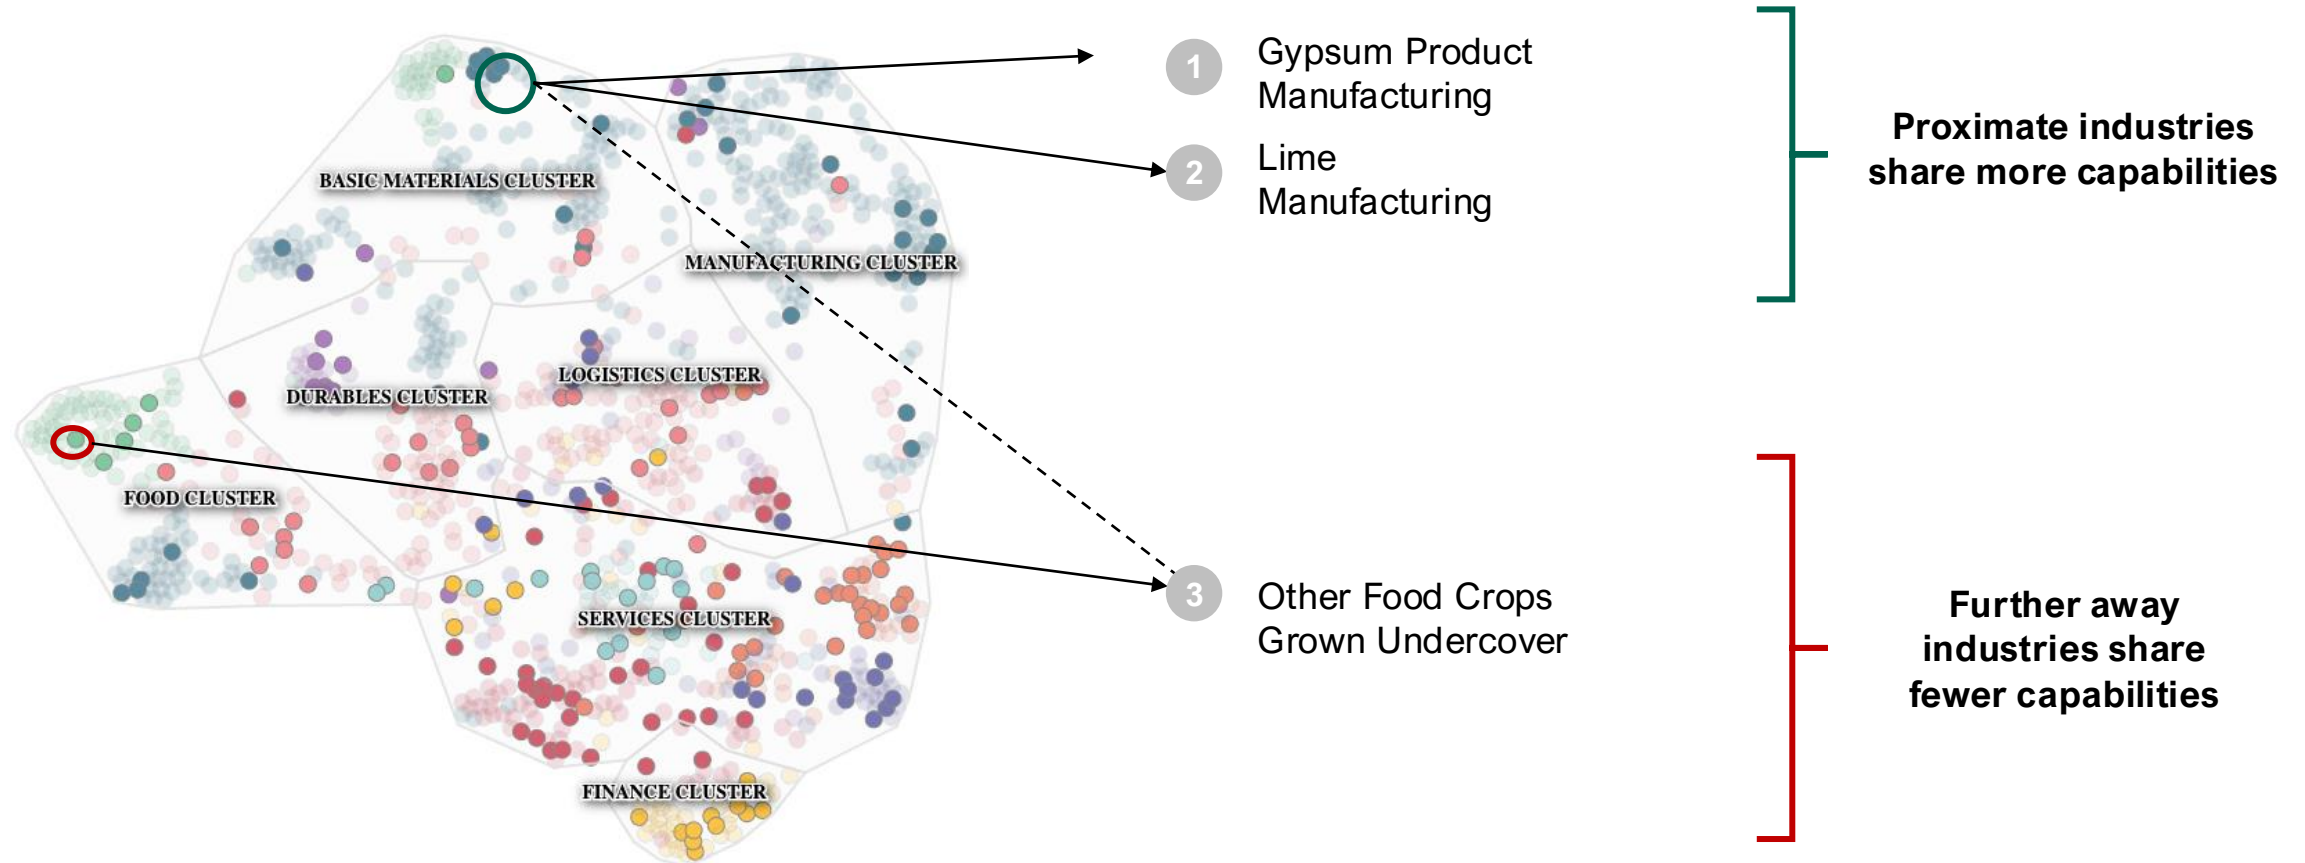

➤ *The industry space is the visual representation of the relatedness between all the existing industries.*

- Each dot represents an industry.
- Each color represents an economic sector
- Each area outlined in grey represents a cluster of economic activity. In each, industries from different economic sectors require similar capabilities.
- The stronger colored dots are industries with a significant presence in Bernalillo County commuting zone relative to the rest of the US (RCA > 1).

Which industries are more alike? It's all about their position

➤ *Proximity tells us how similar two industries are.*

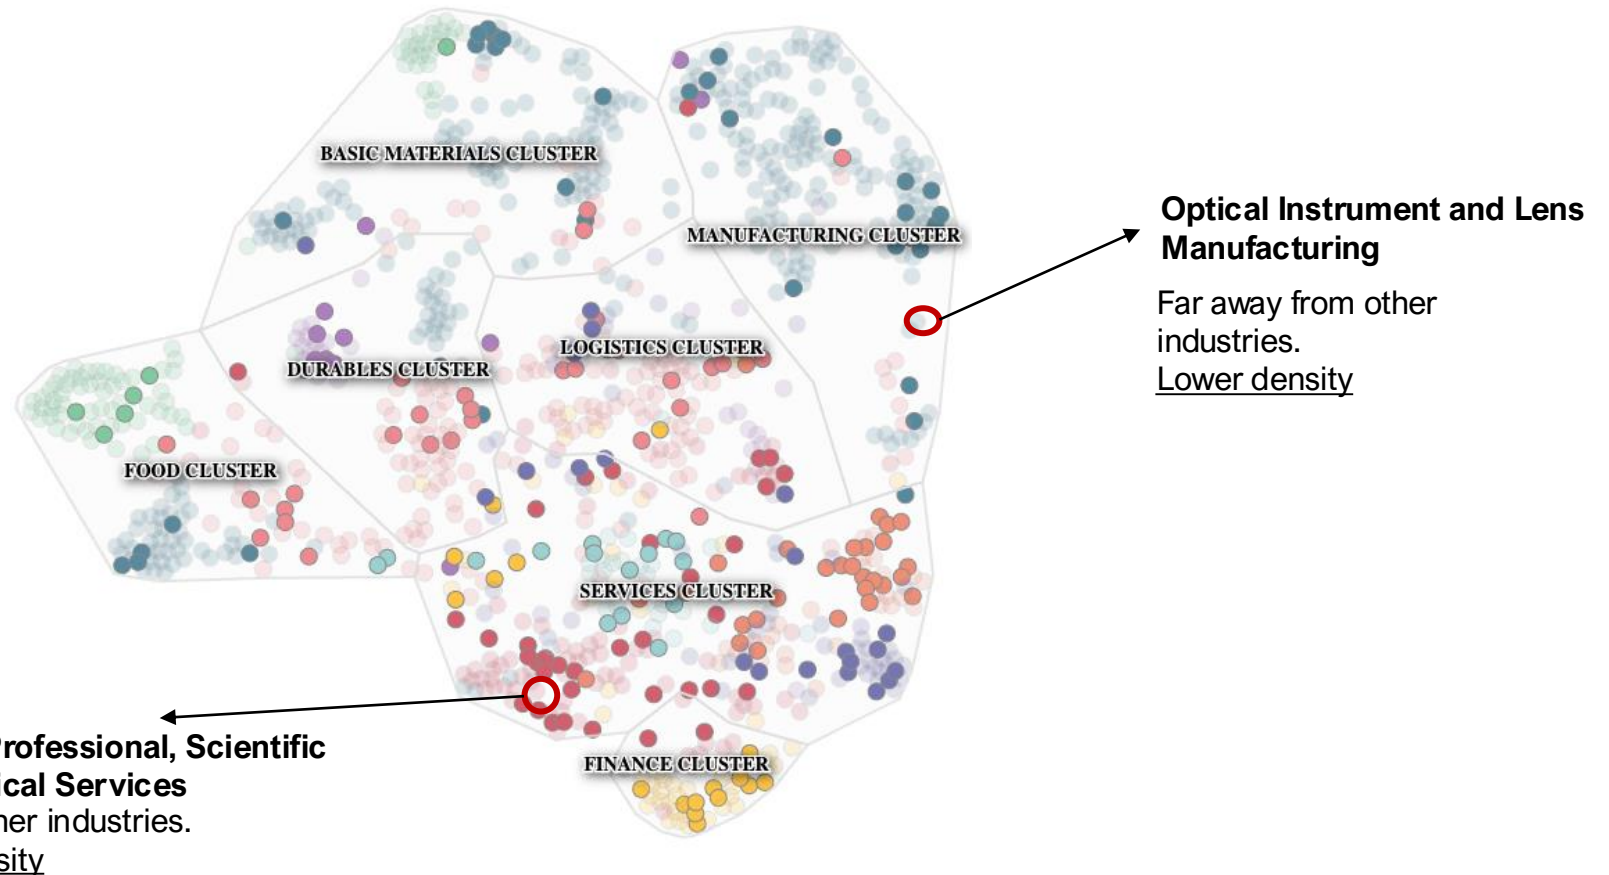

What industries require similar capabilities as those found at Bernalillo?

Depends on their proximity to current industries

➤ ***Density considers the connections between an industry and the CZ's current economic activity. It provides a notion of which other industries the productive capabilities could support.***

When thinking about new industries, development will be easier if the industry is located in a part of the industry space where Bernalillo already has significant economic activity and strong capabilities. Regions typically grow by developing these

Our analysis is built on three cornerstones

Local Capabilities

Industries Relatedness

Tradable Income

Which industries can bring external income to Bernalillo?

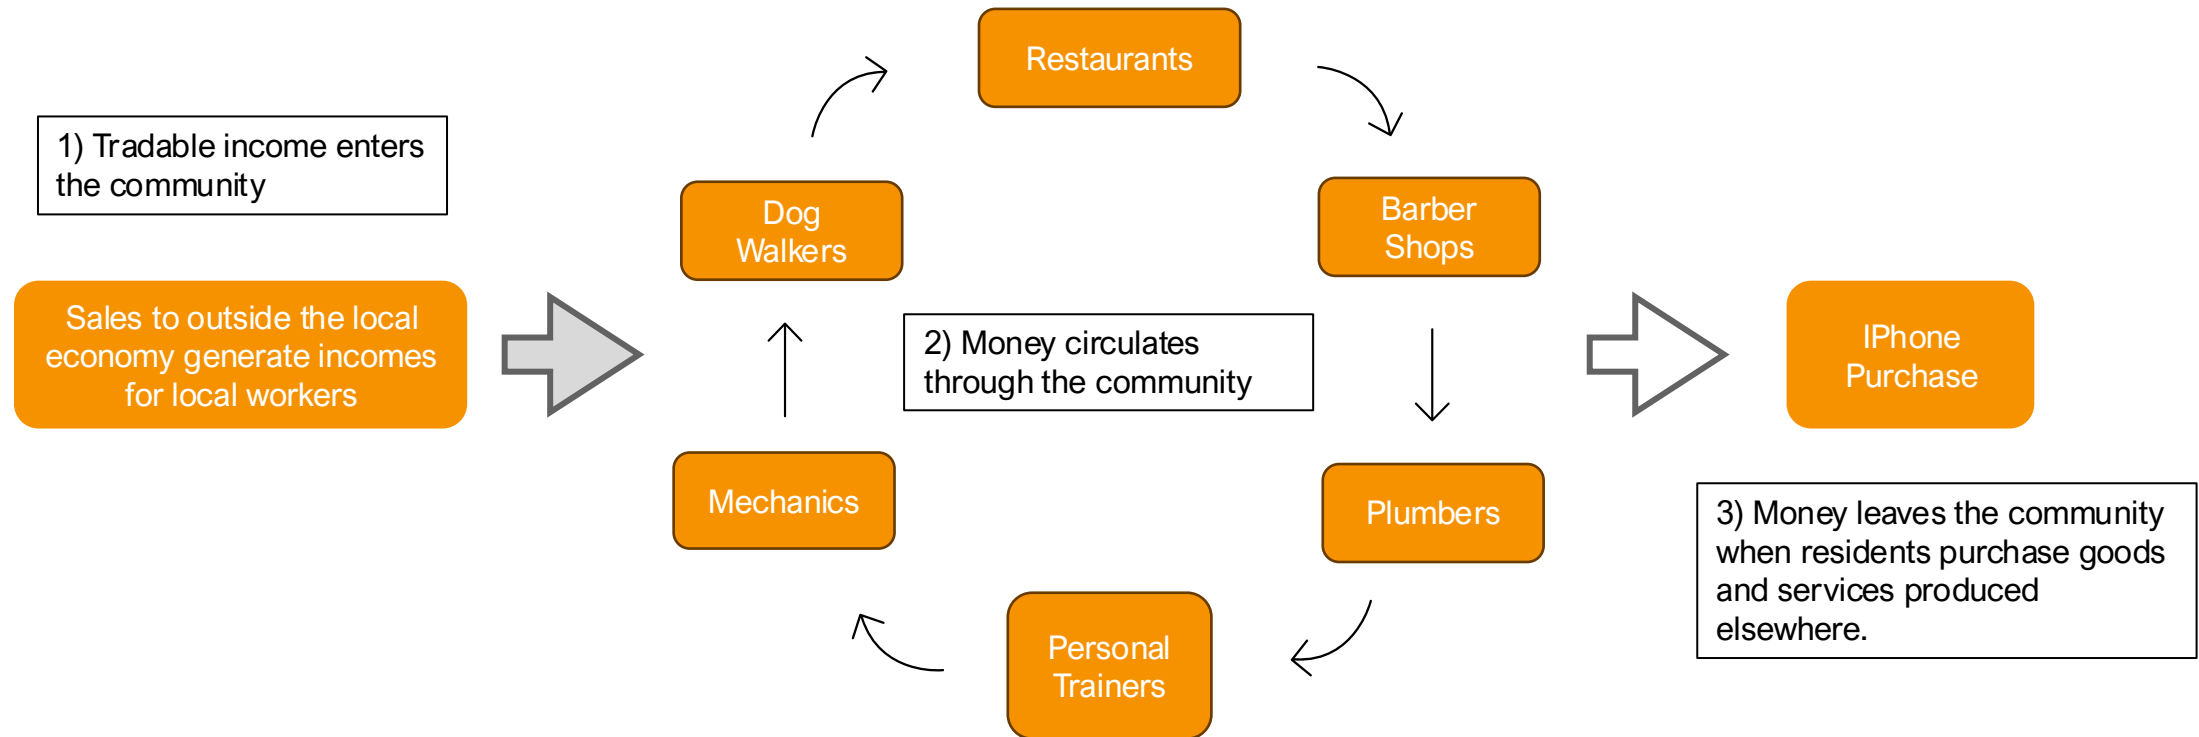

Tradable or base industries that export goods and services

What are the industries that could bring external income to Bernalillo?

The relevance of tradable income

➤ ***Tradable income is jargon for money generated from stuff that a local economy sells beyond its borders. It essential for economic survival as it allows to purchase goods and services that are not produced locally and creates local jobs.***

There are 1012 industries (6-digit NAICS 2022 code). Using County Business Pattern (CBP) dataset from Eckert et al. (2021), Growth Lab research has determined that 52% of them are tradable.

What are the opportunities in the tradable sector? RCA and Density as criteria

Remember:

- 1 **RCA.** What is Bernalillo good at?
- 2 **Density.** How close is an industry to the Bernalillo's existing capabilities?

Defining the groups. The first threshold for group definitions is set at $RCA = 1$ (or 0.50 on the scaled horizontal axis), separating industries with relatively larger and smaller local presence. The second threshold uses the median density among all tradable industries to identify those most similar to the local productive capabilities. The focus is on industries above the median density, as they are more closely aligned with existing capabilities.

How to start exploring promising industries

- **Wide set of possibilities.** The analysis highlights over 200 potential industries for growth (either by supporting industries already established locally or by creating conditions for new ones with potential to thrive). Ultimately, choosing which industries to pursue depends on local priorities, assets, and experience. The following slides and the [attached dataset](#) offer multiple ways to explore these opportunities. There is not a unique way of using these resources.
 - **First pass.** If you're unsure where to begin, start by reviewing the visuals that display all opportunities by category (Manufacturing, Trade, Services, and Natural Resources) to get a sense of the landscape. Alternate between the visuals and the dataset, and make note of any industries that immediately catch your attention for further exploration. The dataset provides several variables for each industry, but at this stage, simply flag those that seem particularly relevant or interesting for your context. You can later assess which of these options are most practical or realistic based on the specific conditions required for development.
 - **Exercise caution with opportunities that feel off.** Promising industries are identified based on their similarity to the local economy's capabilities, but a perfect fit is uncommon: some capabilities (skills, infrastructure, or inputs) may still be missing, especially for new or emerging sectors. The next step is to identify and assess these gaps with input from local firms and industry partners. In some cases, missing capabilities (like climate conditions for "Cotton Ginning") or unfavorable market conditions (as with "Support Activities for Coal Mining") mean the opportunity isn't realistic or practical. It is recommended to set aside options that clearly do not fit local conditions and instead focus on opportunities that align better with community strengths and potential.
-

Already competitive industries in Bernalillo's commuting zone

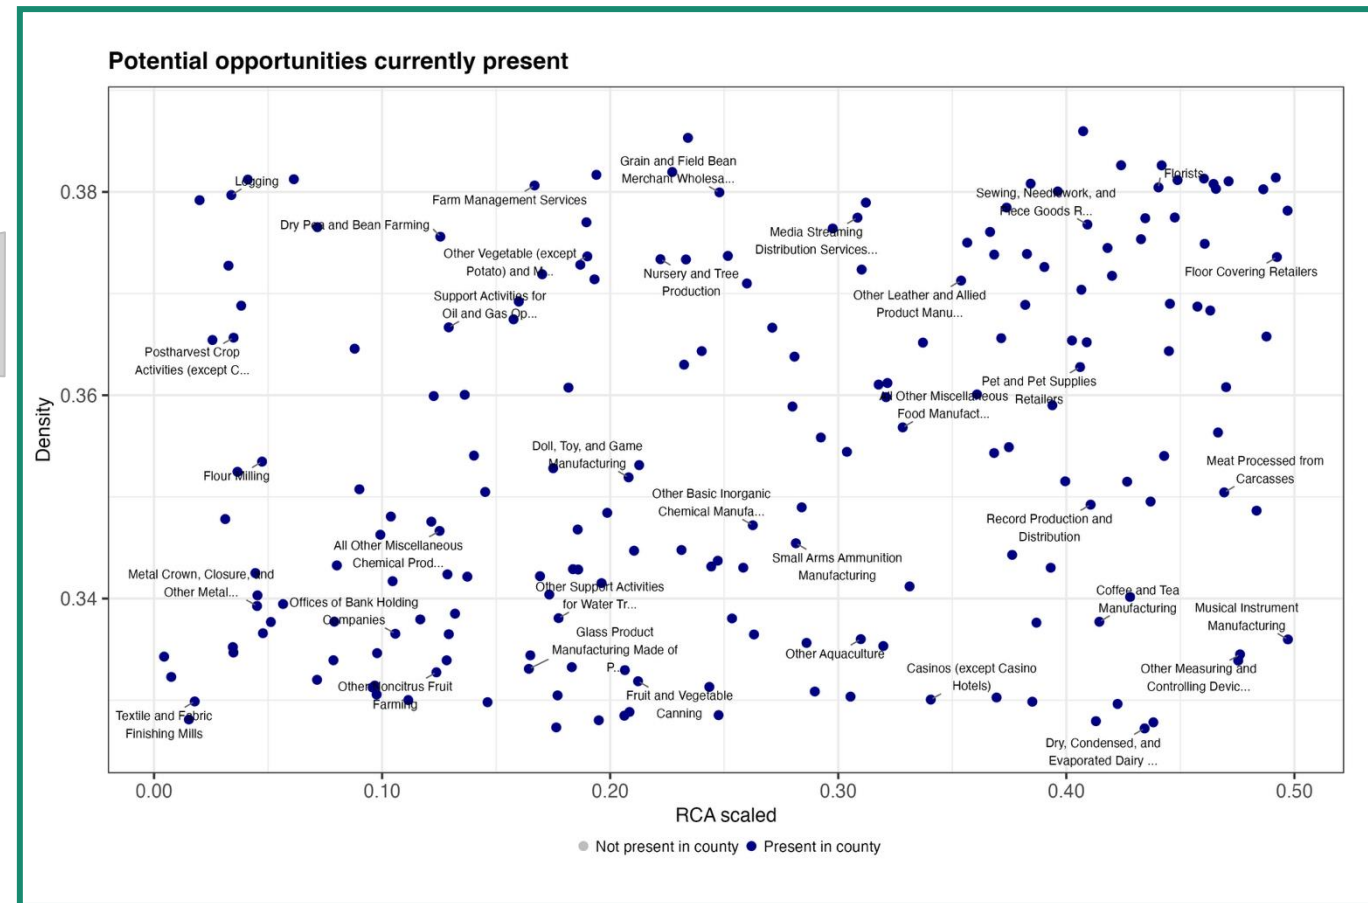

Industries in the top-right quadrant already have a strong foothold in Bernalillo ($RCA > 1$ or $RCA \text{ scaled} > 0.5$). A development strategy could focus on creating the right conditions – such as infrastructure, skilled workforce, and supportive policies – to help them grow and thrive even further.

Potential opportunities currently present in the county

Industries in the top-left quadrant are particularly relevant for the county's development strategy because they already have some presence and are closely related to existing capabilities. In other words, they hold significant potential for growth. A development strategy could focus on creating the right conditions to help these industries flourish.

Industries further away from Bernalillo's capabilities

The analysis does not focus on this set of industries because their requirements are not closely aligned with Bernalillo's current capabilities. Industries with little local presence are unlikely to take root, while those with a larger footprint but a weak fit are more likely to shrink or eventually leave the community.

We identify 209 industries with potential opportunities.

Four major categories.

Several industries in Bernalillo offer emerging and new promising opportunities for increased tradable income. While these industries are not yet as competitive in Bernalillo as in other parts of the U.S., they share capabilities with industries that are already strong locally. This means they could expand relatively easily if the right conditions are in place.

Manufacturing

96 industries as potential opportunities

Trade

31 industries in retail and wholesale

Services

33 industries across different sectors

Natural Resources

48 industries in Agriculture and mining

Potential opportunities with high and medium level wages.

143 industries across categories

➤ ***Industries are grouped by wage levels using U.S. averages: the top 25% are classified as high-wage, the bottom 25% as low-wage, and the rest as medium-wage. The analysis focuses on high- and medium-wage industries, as these are more likely to provide quality jobs and stronger economic benefits for the community.***

How to further assess the selected options

- **Background.** After selecting a list of industries that feel particular relevant or attractive, the next step is to figure out which are the missing capabilities and what can be done, if anything, to provide them.
 - **Dataset as a reference.** The dataset provides useful information about potential gaps in productive capabilities, such as electricity needs or supply chain positioning, but it is not meant to offer all the answers. Instead, it serves as a starting point for further questions and discussions among local stakeholders. For instance, while the data show which industries have added or lost jobs in recent years, understanding the underlying reasons requires local and industry insights.
 - **Examples as guidance rather than prescription.** External analysis cannot replace local insight or dictate which industries to target. The following slides highlight selected industries and explore various dimensions of each, not to prescribe priorities, but to demonstrate how to use the dataset's variables to prompt questions and guide decision-making. The examples focus on "Potential Opportunities" with medium or high wages that already have some local presence. The industries are drawn from sectors highlighted in the previous section, and Manufacturing because this sector offers additional variables to consider.
 - **Review process.** The examples start by comparing job trends at the local, regional, and state levels to provide an overview of growing industries and to prompt consideration of the factors enabling or hindering growth. For some industries, job data may not be available. In these cases, reaching out, perhaps with help from the local Economic Development Organization (EDO), to firms already active in the industry can offer valuable qualitative insight. The examples then explore additional variables that assess industry attractiveness and specific requirements.
 - **Build your own story.** Apply this approach to other industries of interest by examining all available variables in whatever order makes the most sense for your context. Engage local partners early and often to provide further insight and complement the analysis. The aim is to use this process to spark productive questions, identify the most promising opportunities, and guide actionable next steps for supporting industry growth in the community.
-

Are local conditions favorable or holding this industry back?

In this graph, the x-axis shows the number of starting jobs in each industry, providing a sense of the industry's initial size and its potential contribution. The y-axis displays the average number of jobs added or lost per year, rather than growth rates, since several industries began with zero employment. The total was divided by the number of years between the earliest and latest data points for each industry. The axes were capped to improve visualization.

Is the industry facing a different situation elsewhere?

Same axes as the previous graph but for different regions. For neighboring counties, only those that share a border, whether in-state or out-of-state, and are not part of the commuting zone were included. In this case, the selected counties are Santa Fe and Cibola in New Mexico. While barriers to grow may not be obvious for every industry, they could be more evident in some cases than in others.

How attractive is Bernalillo's location for the industry?

The competitiveness of some industries depends more on proximity to inputs, while others rely on being close to consumers. By identifying each industry's main inputs and where they are produced and then calculating the driving time from the county to those locations, a "remoteness to inputs" score is created. A similar score for demand is based on the location of main consumers. Together, these scores allow the county's position to be ranked relative to others in terms of access to both inputs and markets.

Bernalillo's commuting zone is closer to the required inputs for "Coffee and Tea Manufacturing" than almost 20% of U.S. counties, and closer to the demand than 17% of other counties.

Can Bernalillo meet the electricity needs of the manufacturing industry?

Is Bernalillo equipped to supply the manufacturing industry with enough water?

The x-axis shows the average daily water use per establishment (in gallons per day) for each manufacturing industry. Only manufacturing industries are included due to data availability.

Can Bernalillo provide the necessary space for the manufacturing industry?

The x-axis shows the average land needed per establishment (in acres) for each manufacturing industry. These estimates assume low-density facilities, typically single-story buildings that are more spread out and need extra space for parking, trucks, and outdoor operations. Beyond utilities, communities must have suitable sites ready to host new or expanding businesses, with the right access to essential services.

Growth Lab

Identifying local opportunities: Bernalillo County

January 2025
